

ABSTRACT

2 A bed pad wedge system for inhibiting a person from falling out of bed. The
3 system includes a fitted mattress pad fastened to a mattress. Each lateral edge of the
4 fitted pad has pockets located therein that contain foam rubber wedges having the
5 shape of an obtuse triangle. The pockets are installed on an underside of the fitted pad
6 and are facing an outer edge of the mattress. The triangular foam rubber wedges are
7 each encased in a slippery material to aid in installing the wedges in the pockets. A third
8 wedge or triangle may be installed in the middle of a mattress between the outer
9 wedges that are located at each edge of the mattress. The wedge system may be
10 covered by standard sheets and bedding.
